CLEAR

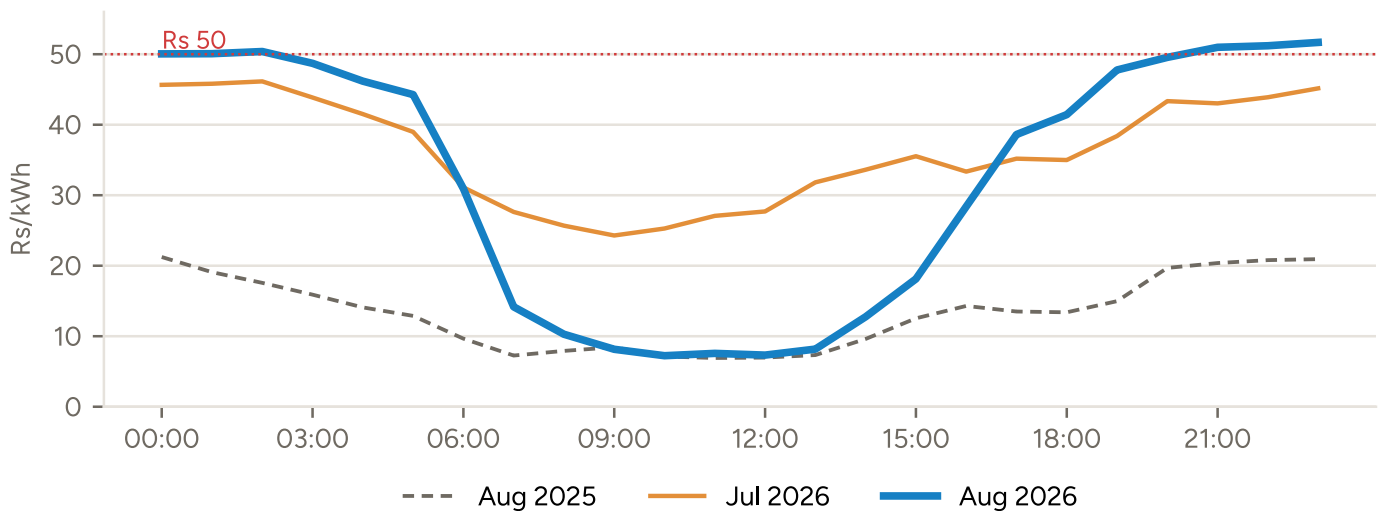

Brent \$91 (Aug), -15% in 3
months

August 2026 averaged Rs 32.2/kWh, down 11% on the month before and up 140% on August 2025.

217 of its 744 hours (29%) were at or above Rs 50, with a high of Rs 65.7 at 02:00 on 31 Aug.

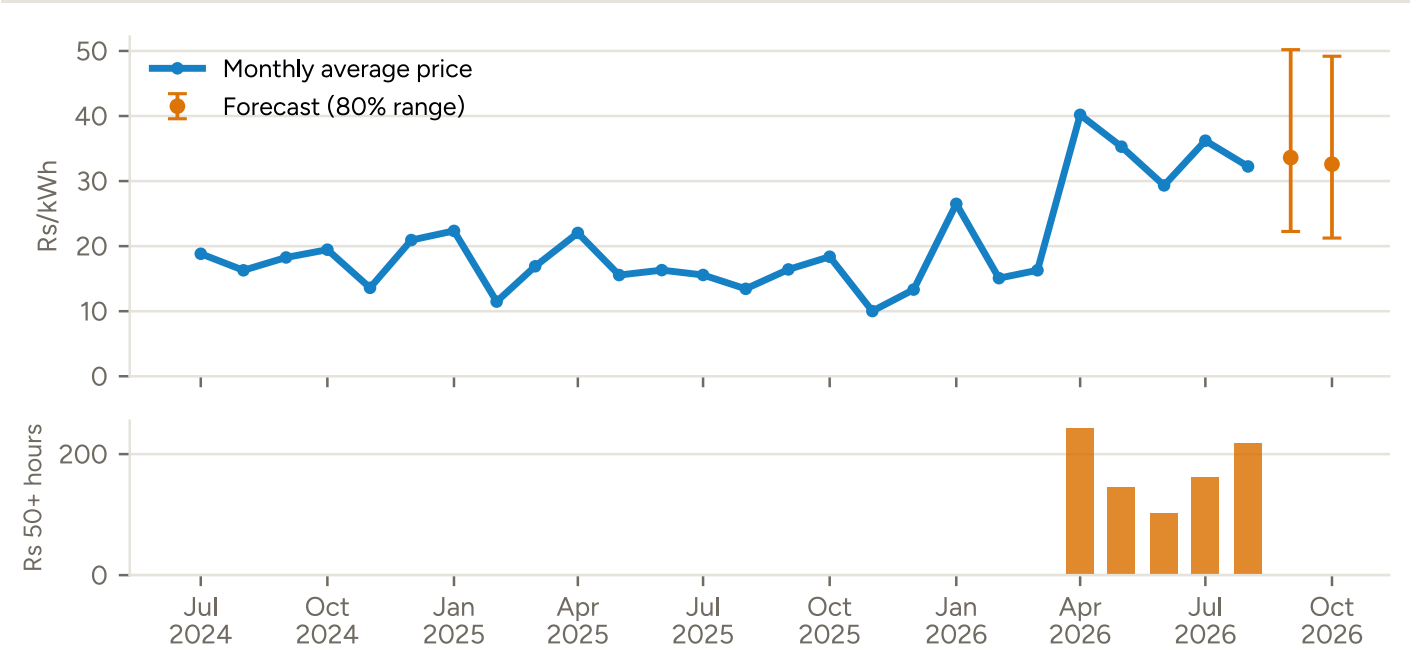

The day split in two: midday hours (10:00-16:00) averaged Rs 10.2 while the night (00:00-06:00) averaged Rs 48.3. Solar output pushes cheap plants onto the margin at midday; after sunset the system falls back on expensive thermal plants.

The average day

Average price by hour of day. Hours are hour-beginning, Pakistan Standard Time.

Prices month by month, and the outlook

Top: monthly average price. Bottom: hours at Rs 50 or more. Forecast points are the next-month model's median and 80% range.

FUEL COST BY TECHNOLOGY

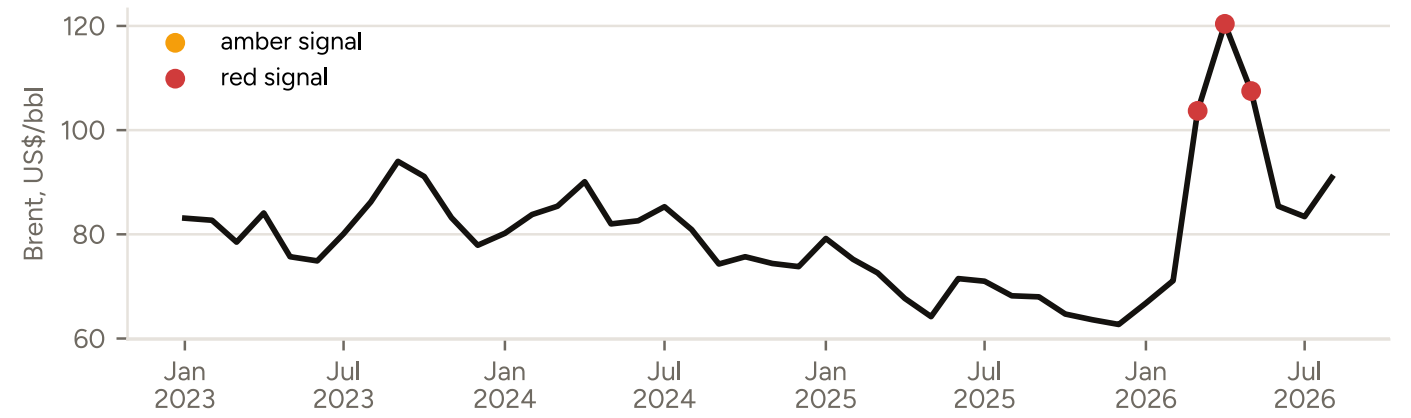

FUEL	FUEL COST, RS/KWH	PRIOR MONTH	TWH
Furnace oil (RFO)	52.2	42.2	0.10
Imported LNG (RLNG)	35.4	30.6	1.46
Imported coal	16.7	17.9	1.70
Thar coal	11.5	11.2	1.36
Local gas	13.7	13.6	0.87
Nuclear	2.9	2.7	1.80

CPPA-G energy purchase data for June 2026 (published with a lag). Fuel charges divided by energy bought; the most expensive fuel that runs sets the evening price.

FUEL-SHOCK MONITOR: CLEAR

Brent averaged \$90.9/bbl in August 2026: +9% on the month, -15% over three.		
LNG (Japan), US\$/mmbtu	13.9	+8% (3m)
Coal (Australia), US\$/t	135.2	-1% (3m)
Gas (Europe), US\$/mmbtu	21.1	+31% (3m)

Why oil: the Rs 50+ hours are furnace-oil plants setting the price. Brent rose 46% in March 2026, the month before those hours began.

Red: Brent at or above \$90 after rising 30%+ in three months. Amber: a rise of 30%+ in three months or 20%+ in one, from \$75+. Since 2018 it has fired in: Mar 2022 (red), Mar 2026 (red), Apr 2026 (red), May 2026 (red). With one regime change in the price history, this is a monitor, not a validated predictor.

WHICH PLANT SET THE PRICE

Furnace oil plants set the price in 33% of hours, and 52% of evening hours (18:00 to midnight). The plant that set it most often was KEL (K-Electric), on furnace oil, in 98 hours.

FUEL	ALL HOURS	EVENING	PLANT	HOURS	RS/KWH
Furnace oil	33%	52%	KEL (K-Electric)	98	54.06
Coal	28%	3%	Punjab Thermal Power	93	41.76
Local gas	13%	2%	Thar Coal Block-I	63	5.39
Imported LNG	13%	12%	Nishat Chunian Power Ltd	57	50.65
Diesel	1%	3%	Jamshoro (Coal)	39	15.02
Low-sulphur furnace oil	1%	3%			
Between two fuels	11%	25%			

Each hour's official price matched to ISMO's merit order in force (plants ranked by running cost). Exact plant known for 74% of hours, fuel for 89%; the rest lie between plants on different fuels. Evening = 18:00 to midnight.

Outlook

MONTH	AVERAGE, RS/KWH	80% RANGE	MIDDAY (10-16H)	EVENING (18-24H)	USES PRICES TO
September 2026	33.6	22.3 - 50.2	29.4	37.2	end of July 2026
October 2026	32.6	21.2 - 49.2	22.0	40.8	end of August 2026

Next-month model: the same-hour average of the last three published months, with a range from its own past errors. ISMO publishes a month's prices 2 to 5 weeks after it ends, so a forecast for month T can only use prices to the end of T-2. The range is the average of hourly ranges; single hours spread wider.

Day ahead, 01 September 2026: median Rs 41.5/kWh across the day; 14 hours expected at Rs 50+ (00:00-07:00, 17:00-00:00); 14 possible, where the upper band crosses Rs 50. For a participant with daily price data; the public file arrives monthly.

HOW THE FORECASTS HAVE DONE

MODEL	HORIZON	ERROR, AUG 2026	ERROR, 2026 TEST	80% RANGE HELD
Our live model (blend)	day ahead	Rs 5.67	Rs 7.66	71%
Same hour yesterday	day ahead	Rs 5.92	Rs 7.94	69%
Our model (3-month profile)	next month	Rs 14.52	Rs 13.11	56%
Same hour, last known month	next month	Rs 16.11	Rs 15.35	49%
ISMO's CTBCM projection	next month	Rs 18.14	Rs 14.58	

Error: mean absolute difference from the published price, Rs/kWh per hour. Walk-forward: every forecast used only data available at the time. The 2026 test (January onward) was never used to choose models, except the blend, chosen after it; its forward record starts September 2026. ISMO's projection, built on September 2025 inputs, is compared at the monthly horizon.

For bulk consumers weighing open access

At August's prices, a 5 MW B-3 factory running around the clock would have paid **Rs 48.5/kWh** buying at the hourly market price through the wheeling auction, against **Rs 30.6/kWh** on its DISCO tariff: Rs 17.9/kWh more. Energy alone, grossed up for network losses, came to Rs 36.1/kWh.

The highest fixed contract price at which open access still breaks even for this factory: **Rs 18.9/kWh** at the generator through the auction, **Rs 7.3/kWh** outside it (where the Rs 12.94 stranded-cost charge applies).

Grid charges per NEPRA's uniform Use of System Charges decision (7 Sep 2026); losses, capacity and ancillary costs as in ISMO's CTBCM model; regulated tariff per NEPRA decision TRF-100 of 11 Feb 2026. Excludes sales tax and duty, which apply to both routes.

Data quality

The latest automated check of the public source data found 3 critical issues and 22 warnings; the critical ones:

ismo monthly profiles	Published as Jul 2024 but the whole workbook is Jun 2024's (identical to the file published for that earlier month); file a56484f3, posted in 5 section(s): DISCO's Consumption, Fuel Mix, Hourly Generation Profile, Marginal Price vs Demand, System at Glance. Anyone using ISMO's site for Jul 2024 gets the wrong month.
ismo monthly profiles	Published as Jan 2025 but the whole workbook is Mar 2025's (identical file also published as that month, and it fits that month's hourly prices); file f2cf7e0b, posted in 1 section(s): Marginal Price vs Demand. Anyone using ISMO's site for Jan 2025 gets the wrong month.
ismo monthly profiles	Published as Apr 2025 but the whole workbook is Mar 2025's (identical file also published as that month, and it fits that month's hourly prices); file f2cf7e0b, posted in 4 section(s): DISCO's Consumption, Fuel Mix, Hourly Generation Profile, System at Glance. Anyone using ISMO's site for Apr 2025 gets the wrong month.
